Post Laser Wart Treatment Care

Areas treated may remain numb for 1-2 hours after treatment.

You may need Ibuprofen (Advil) for pain management after treatment. We suggest 200mg tablets (2-3 tablets) taken with food every 8 hours.

Expect the healing process to take 3-4 weeks.

You may experience mild swelling, discoloration or a blister. You may drain any blisters by washing the area first and then take a sterile needle to puncture the area to relieve any fluid buildup. Try not to remove the roof of the blister. This should help alleviate some discomfort.

After draining the area, follow by soaking the treated area in 1/2 hydrogen peroxide & 1/2 water.

You may apply Bacitracin or Aquaphor/Vaseline daily and cover with a bandage for comfort.

If there is intense pain lasting longer than a week, please call the office. The area may need to be drained.

No restrictions are necessary during the post treatment period.

Please call our office with any questions related to the healing process.
